

+3V3 STM32 power supply

VBUS = +9V from external battery

+5VA for analog section

USB 2.0 Type C for data transfer only

PCB will be 2 layer, so keep USB lines very short. Can also add DNP 100R resistor between USB lines.

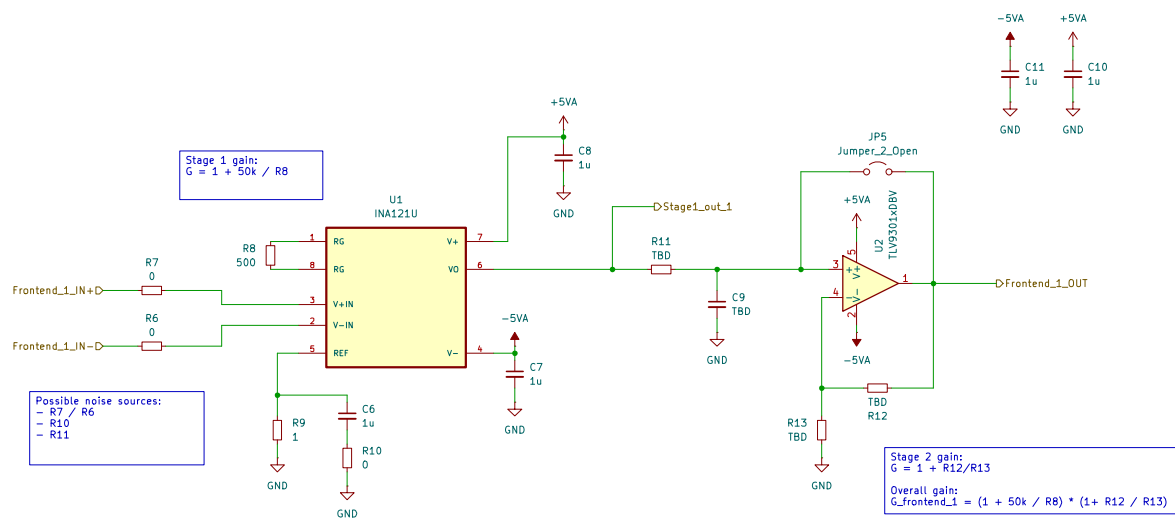

-5VA for analog section

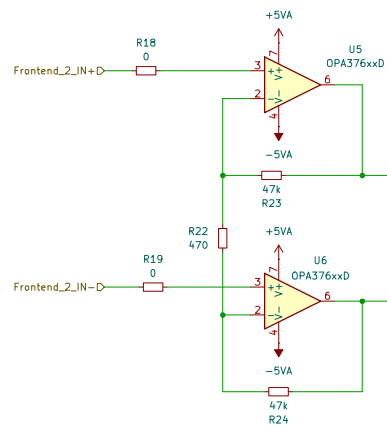

Pin 6 (LV) has to be NC for $V+ \geq 3.5V$
Pin 8 (V+) can be connected through C28 to pin 7 (OSC) in order to slow down the internal 10kHz oscillator.

Power status LEDs

Stage 1 gain:
 $G = 2 * (1 + 2 * R23 / R22)$

Possible noise sources:
 - R18 / R19
 - R21
 - R17

Stage 2 gain:
 $G = 1 + R12/R13$
 Overall gain:
 $G_{\text{frontend}_2} = 2 * (1 + 2 * R23 / R22) * (1 + R12/R13)$
